```
The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimmlatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allery, including rhinitis, uricaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                    Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismacch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises nor nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-bothybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of mRNA molecules by contact and a contact an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at segdata.uspto.goc/sequence.html

New Fas associated proteins PTP-BAS types 4 and 5 - involved in

```
the invention traces to a mucier active computation at the control of the signal sequence having at least one signal sequence unit or a mixture of units, the signal sequence causing a transmembrane transport of the nucleic acid, the solological system. The invention also relates to a vector containing the nucleic acid, a host organism containing at least the nucleic acid or the vector, a method of producing the nucleic acid, the vector, a pharmaceutical composition comprising the nucleic acid, the vector or the host organism and optionally a pharmaceutical carrier and/or diluent and a kit comprising the nucleic acid, the vector or the host organism. The conclectide sequence further contains at least one second nucleotide sequence to be transported and/or one or more components covalently linked and/or forming a complex with the first and/or second nucleotide sequence, where the covalently linked and/or complexed components are biologically active. The nucleic acid, vector or host organism is useful for preparing a pharmaceutical composition for treating genetically based disorders. This sequence represents a signal sequence-containing
                                                                                                                                                                                                                                                                                                                                  ö
programmed cell death, used for modulating apoptosis, e.g. for treating cancer, and for identifying other modulators.
                                                                                         The cDNA sequence encoding the cytoplasmic domain of human Fas (AA 191-335) was modified by PCR mutagenesis using this primer along with the corresponding reverse primer (AAT18389) and another forward (AAT18386) and reverse (AAT18337) primer set. It was then subcloned in frame into plasmid pEG202 to produce plasmid pEG/Fas(191-135). The cDNA sequence the cytoplasmic domain of human Fas was then subcloned into the ECORI site of pEG302, in-frame with the upstream LexA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid comprising a first nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid comprising a first nucleotide sequence having at least one signal sequence unit or a mixture of units, the signal sequence causing a transmembrane transport of the nucleic acid in a biological system. The invention also relates to a vector containing the nucleic acid, a host organism containing at least the nucleic acid or the vector, a method of producing the nucleic acid, the vector, a nethod of producing the nucleic acid, the vector or the host organism and optionally a pharmaceutical carrier and/or diluent and a kit comprising the nucleic acid, the vector or the host organism. The nucleotide sequence further contains at least one second nucleotide sequence further contains at least one second nucleotide sequence to be transported and/or one or more components covalently linked and/or second nucleotide sequence. Where the covalently linked and/or complexed components are biologically active. The nucleic acid, vector or host organism is useful for preparing a pharmaceutical composition for treating genetically based disorders. This sequence represents an oligonucleotide used in the scope
                                                                                 ö
                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid promoting transmembrane transport of nucleic acids, useful for treating genetically based disorders.

                                                                                                                                                                                                                                     The invention relates to a novel expression vector comprising an enhancer sequence and a reporter gene. The enhancer sequence comprises a variable number of tandem repeat (VWTR) and is found in the 3' non-coding region of the human dopamine transporter (DAT) gene. The enhancer sequence is expession vector of the invention has antiparkinsonian, neuroleptic, and antidepressant activity, and may act as a dopamine transporter gene expression vector of the invention has antiparkinsonian, neuroleptic, and antidepressant activity, and may act as a dopamine transporter gene expression vector is useful for identifying a compound capable of regulating the expression of a target gene (preferably human dopamine transporter gene) that comprises an enhancer sequence. A compound of the invention is useful for treating Parkinson's disease and schizophrenia that are associated with reduced and increased levels of dopamine, respectively. The present sequence is used in the exemplification of the
Novel expression vector comprising reporter gene and a reporter genetranscription promoting enhancer sequence that has a variable number of tandem repeat and is found in 3'non-coding region of human dopamine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more tocleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The mucleic acid probes and detecting the hybridisation. The mucleic acid probes and detecting the hybridisation. Each of the nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primare extensions or in screening SDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been contained and previously sequence. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly from USPTO at sequence thml
                                                                                                                                                                                          New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 60.8%; Score 14.6; DB 9; Length 25; Best Local Similarity 81.0%; Pred. The method is useful for preparing an expression vector for therapeutic protein production, in particular human erythropoietin (BPO). The vector produced by the method is useful for BPO expression in suitable transfected eukaryotic cells or in the mammary gland of transgenic organisms. The present sequence represents a translational consensus WAP-EPO sequence with NotI modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the preparation of an expression vector for the

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or analysis of genetic variation or in hybridisation of rag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises morrises of at least one target sequence. The method of analysis comprises more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises mointoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The sequence or specific matations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the containing the containing of DNA that have been isolated and previously sequenced. The sequence presented is one of the form of the containing the microarray. Note: The sequence of the form of the containing the contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                           New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library. In analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acid set least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are strached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring of amily members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in situ hybridisation, in Southern, Northern or dottober thybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                         New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence is a PCR primer used to amplify the EGF sequence in COS cells infected with non-targeted M13 phage and EGF-phage. The maplification primers have sequences located on each side of the EGF sequence in the gene III coding sequence. The PCR products were digested with restriction endonucleases and ligated into a new phage vector and used to transform competent bacterial cells by electroporation. Plaques consider the analysed via PCR using oligonucleotides which included the present sequence. Four rounds of selection were sufficient to enrich the targeted EGF-phage to 100%. This selection procedure is a useful example of a novel method of selecting internalising ligands displayed on a genetic package carries a gene encoding a detectable product expressed on internalisation. The method is referred to as Ligand Ingends that may be useful as antibacterial agents or in gene therapy. The method is also useful for studying protein-protein interactions that lead to cell transduction and identifying cells which are transduced by the ligands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                   The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or an analysis of genetic variation or in hybridisation to a DNA library, of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of the probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of mucleic acid subsciling in situ hybridisation, in Southern, Northern or dotprobes is useful in in situ hybridisation, in Southern, Northern or dotprobes is useful in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence and previously sequenced. The sequence presented is one of the norther more containing be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                       New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                       The invention relates to a method for selecting ligands that internalise and facilitate transgene expression, comprising displaying on a phage carrying a transgene encoding a detectable product, and recovering a nucleic acid molecule encoding the ligands from the cell expressing the detectable product. The methods are useful in selecting and identifying ligands displayed on a phage that internalise and facilitate transgene expression, and also in identifying transduction facilitating peptides. Internalising ligands identified by the methods are useful in gene delivery methods and as anti-bacterial agents. The ligands and antiligands identified by the treatment of e.g., cancer and restenosis. The method is also useful in that it allows identification of molecules that are targets for new discovery. This sequence represents a PCR primer used to amplify a ligand gene III fusion of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CpG immunostimulatory oligonucleotide; immune response; allergy; asthma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                        The invention relates to a class of CpG immunostimulatory of objigonucleotides containing a 5TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, cervical cancer, choricoarcinoma, colon cancer, endometrial cancer, gastric cancer, invaphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, brain and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer, testicular cancer, as well as other carcinomas and sarcomas. The invention is also useful in gene therapy. The present sequence is a CpG invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of regulating apoptosis in a cell comprising targeting an abnormally or alternatively spliced mRNA, an abnormally or alternatively structured mRNA, or a product of either. Also described are: a nucleotide construct with a nucleotide sequence which is homologous to mRNA transcribed from an abnormally spliced gene; an agent selected from small molecule or protein; polypeptide; peptide; aptamer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Regulating apoptosis in a cell, useful for treating cancer, comprises targeting an abnormally or alternatively spliced mRNA, an abnormally or alternatively structured mRNA, or a product of either.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; gene therapy; apoptosis modulation; pharmaceutical; cancer; cytostatic; neoplasm; Bcl-2; reverse transcriptase PCR; RT-PCR; primer;

continuents authorate, actual purpreparture of nuclear agent interacts with or binds with a protein expressed by an abnormally spliced mRNA for use as a medicament or for the manufacture of a medicament for the treatment of cancerous cell growth, a pharmaceutical composition comprising a nucleotide construct such as siRNA, anti-sense RNA, shRNA or miRNA; or the agent cited above, and a pharmaceutical composition comprising a nucleotide construct such as paramaceutical diluent or carrier; a DNA or RNA expression vector comprising an expression cassette including the nucleotide sequence selected from: the nucleic acid sequence of the abnormally spliced gene element as given in the specification; a nucleic acid molecule which hybridizes to the nucleic acid sequence of (a); and a nucleic acid molecule which hybridize to the nucleic acid sequence of (a); and a nucleic acid molecule which hybridized to the sequences in (a) and (b) and any sequence which is complementary to any of the above sequences, where the expression cassette is cannoformed to a pronder sequence. The method is useful for regulating apoptosis in a cell or for treating cancer. The agent or conclectide construct is useful as a medicament for the treatment of cancerous cell growth. The DNA or RNA expression can an expension of an anoisottic construct is used in the targeting of an abnormally spliced construct is used in the targeting of an abnormally spliced construct is a seed in the targeting of an abnormally spliced construct is also as a medicament for treatment of construct is used as a medicament for treatment of construct is used as a medicament for treatment of construct is used in the targeting of an abnormally spliced construct is also an enterest treatment of construct is used as a editor or coll growth. The DNA or RNA expression vector is used as a delivery means or the product. This sequence represents a reverse transcripture of construct is also an entered or an enter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a PCR primer that was used to amplify DNA

encoding a protein that is specific for pathogenic strains of Neisseria. The polynucleotides, polypeptides, or their antigenic fragments, are used in vaccines to treat or protect against Neisseria infections, particularly by N. meningitidis. The polynucleotide sequence is also used for recombinant production of the polypeptide and to produce attenuated Neisseria strains that overexpress it, or express it in a non-toxic

The present invention describes a synthetic composition, which comprises collagen, fibronectin and at least one cell. Also described are: (1) a construct prepared by a method (MI) comprising: (a) preparing a solution comprising collagen and fibronectin; (b) suspending endothelial cells in the solution of step (a), where the suspended endothelial cells in the solution of step (a), where the suspended endothelial cells comprise a nucleic acid encoding a caspase-resistant Bel-2 polymetries, and (C) polymerising the collagen within the solution of step (b) to form a three construct produced by the method of (1); (a) a method (M2) of animal implantation comprising comprising in a method (M3) for forming endothelial cells into tubbes within a comprisity; (4) a method (M3) of producing endothelial cell tubules in vivo; (5) a method (M3) of producing endothelial cell tubules in vivo; (5) a method (M3) of sacularisation; (7) a method (M7) of composition in a tissue or an organ, or in animal; (6) methods (M6) for identifying genes or gene products involved in the process of vascularisation; (7) a method (M7) of composition is useful in methods for forming cultured endothelial cells into tubes within a composition is useful in methods for forming cultured endothelial cells into tubes of forming cultured endothelial cells into tubes within a confinence of kinn only or recipients with impaired vascularisation or impaired engineered skin onco recipients with impaired vascularisation or impaired angiogenesis, or in all aspects of tissue and organ transplantation and grafting. The present sequence represents the 5' end of human Bol-2, with the present sequence represents the sequence represents and organ transplantation and construction and present invention and example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 2; Page 55; 99pp; English.
```

comprise a nucleic acid encoding a caspase-resistant BC1-2 polypeptide, adjusting the solution of step (b) to about pH 7.0-8.0, and warming the solution of step (c) to about 25-40 &degric to form a three-dimensional gel. The method of endothelial cell transplantation promotes vascularisation of human skin equivalents in vivo. Administration can be orthotopic or subcutaneous. The engineered human skin equivalents and methods are useful in treating diseases or conditions involving impaired angiogenesis, such as diabetes, chronic leg ulcers, wounds, acardiovascular disease or burnis. The present sequence represents a Caspase-resistant BC1-2 5'-end terminal fragment

Sequence 31 BP; 7 A; 10 C; 8 G; 6 T; 0 U; 0 Other;

The invention relates to an engineered human skin equivalent, where the skin equivalent becomes perfused in vivo after engraftment on an immunodeficient animal. The method involves implanting onto a skin surface wound of an animal a construct prepared by a method comprising: preparing a solution comprising collagen and fibronecth; suspending endothelial cells in the solution where the suspended endothelial cells

cells,

New synthetic composition comprising collagen, fibronectin and useful for forming cultured endothelial cells for tissue/organ transplantation or grafting onto recipients with impaired

vascularization.

The invention relates to a hybrid oligomer comprising a cyclic AMP response element (GRE) sequence and a sequence that hybridises to the bcl cancer cells in vitro, which comprises contacting the growth of cancer cells in vitro, which comprises contacting the cancer cells with a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; administering a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and a CRE decoy oligomer and a CRE decoy oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer and a Carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and bol-2 antisense oligomer are also useful for preventing or treating hepatitis B virus infection. The hybrid oligomers can also be used for secening candidate transcription factors or other molecules e.g., gene are also very contact or other molecules e.g., gene are also to the paratitis and parasitic disconsise or other molecules e.g., gene are also to the parameter or other molecules e.g., gene are also were the parameter or other molecules e.g.

The invention relates to a hybrid oligomer comprising a cyclic AMP response element (CRE) sequence and a sequence that hybridises to the bcl 2-pre-mRNA or mRNA. Also included are: (1) inhibiting the growth of cancer cells in vitro, which comprises contacting the growth of cancer cells in vitro, which comprises contacting the cancer cells with a tybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; and (3) a pharmaceutical composition comprising a hybrid oligomer or a bcl-2 antisense oligomer and a CRE decoy oligomer; the pharmaceutical composition of the invention is useful for carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer, hyperplasia or tumourigenesis and also bacterial infection, viral infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and catching candidate transcription factors or other molecules e.g., gene requilatory proteins or for diagnostic assays. The present sequence is a screening candidate transcription assays. The present sequence is a Bcl-2 antisense oligomulectide

Also included are: (1) inhibiting the growth of cancer cells in vitro, which comprises contacting the cancer cells with a hybrid oligomer or a bel-2 antisense oligomer and a CRE decoy oligomer; (2) treating or preventing cancer in a human, which comprises administering a hybrid oligomer or a bel-2 antisense oligomer and a CRE decoy oligomer and (3) a pharmaceutical composition comprising a hybrid oligomer or a bel-2 antisense oligomer and a CRE decoy oligomer and a carrier. The pharmaceutical composition of the invention is useful for preventing or treating cell-proliferative disorders e.g., cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             infection, inflammation, anaphylaxis, allergy, arthritis, asthma, autoimmune disorders and parasitic infection. The CRE decoy oligomer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bcl-2 antisense oligomer are also useful for preventing or treating hepatitis B virus infection. The hybrid oligomers can also be used for screening candidate transcription factors or other molecules e.g., gene regulatory proteins or for diagnostic assays. The present sequence is a Bcl-2/CRB hybrid antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hybrid oligomer comprises a cyclic AMP response element sequence and a sequence that hybridizes to the bcl-2 pre-mRNA or mRNA useful for preventing or treating cell-proliferative disorders e.g., cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a peptide acting as agonist, antagonist or inverse agonist on a target receptor. Specifically, it comprises transformation of endocrine cell lines originating from mammalian hypothalamus and pancreatic islets, culturing the transformant and contacting with cells expressing the target receptor. The identification of those cells with a response reaction can be used for selecting a transformant cell line with the appropriate target activity that is expressing the novel transformed DNA. Accordingly, the present invention describes novel cell lines that are applicable in expression cloning systems of bioactive peptide precursor applicable in expression cloning systems of bioactive peptide precursor and in screening GPCR ligands for use as drugs including agonists, antagonists and inverse agonists i.e. activators and inhibitors. Such cell lines can provide a highly sensitive and convenient GPCR ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for obtaining a DNA that encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bioactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kishimoto K, Kunitomo H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Endocrine cell lines originated from mammalian hypothalamus and pancreatic islet, applicable in expression cloning systems of bioactipeptide precursor genes, and in screening G protein-coupled receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    assay system. This oligonucleotide sequence is a PCR primer used amplify human GPCR cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           60.0%; Score 14.4; DB 10; Length 34; 75.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for detecting gene polymorphisms of a gene that encodes cytochrome P450. The method involves using an oligonucleotide and/or a primer selected from those having sequences with at least 13 bases, including the base at position-21 in the base sequences represented by the oligos of 40.41 base pairs, or their complementary sequences, provided in the specification. The method is applicable in obtaining gene information, evaluation of drugs including safety and therapeutic efficacy, and screening drug candidates. This polymucleotide sequence represents one of the 40.41 base pair long oligos used in the gene polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                            cytochrome P450- encoded gene obtaining gene information,

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, the present sequence is one such oligonucleotide. The oligonucleotides and the preteins encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune of diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's diseases), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, concerned the concerned of the nervous system and an infection of pathogenic

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its acid probes including one of 2,018,500 fully defined sequences, or its that of earlies match, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring can eatie and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid probes in situ hybridisation, in Southern, Northern or dottobe and solid sation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by communications of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA to genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence. Then
              New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ACI94310
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                             New pure populations of neuron- or glial-restricted precursor cells and neuroepithelial stem cells from mouse neural tubes or embryonic stem cells for developing new drugs or techniques that enhance survival of transplanted cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides populations of lineage-restricted precursor cells from mouse neural tube and mouse embryonic stem cells. These populations are of neuron-restricted precursor cells (NRPs) and glial-restricted precursor cells (GRPs). These cell populations are useful in the development of new transplant techniques, for transplantation in diseases where neuronal or glial degeneration has occurred, in the identification of drugs which enhance the survival and proliferation of transplanted cells, to identify genes specific to selected stages of development, and in the generation of cell-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, or nanalysis of genetic variation or in hybridisation to a DNA library, or monounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more compounds are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring come expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes in situ hybridisation, in Southern, Northern or dotonce containing sequence or specific containing sequence presented is one of the containing sequence presented is one of the containing acid that have been containing sequence presented is one of the containing acid probes in screening of the microarray. Note: The sequence containing acid probes in sequence of the sequence presented is one of the containing acid probes in serventing of the microarray. Note: The sequence containing acid probes in serventing of the microarray. Note: The sequence containing acid probes in serventing of the microarray. Note: The sequence containing acid probes in serventing the propes in serventing of the sequence or secured in the microarray. Note: The sequence containing sequence or securing the sequence or sequence containing sequence or sequence and presented in the microarray. Note: The sequence containing sequence or sequence containing sequence or sequence containing sequence and sequence containing the sequence or sequence containi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAV05322-23 are used in a reverse transcription polymerase PCR reaction (RT-PCR) to amplify bcl-2 cDNA from human, rat, or mouse thymus total RNA. Bcl-2 genes are anti-apoptotic genes whose products prevent unwanted death of certain cell populations, and are useful for treating neurodegenerative diseases such as Huntingdon's, Parkinson's or Alzheimer's disease. The PCR product was ligated into retroviral vectors LNXS and LNCX, to produce retroviral vectors LNXS and LNCX-bcl-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Capsule containing packaging cells that produce viral vectors for gene therapy - used as replaceable implants in treatment of cancer, atherosclerosis etc., providing localised, long-term vector delivery.
                                                                 protein. The protein is useful for enzyme used in producing oligosaccharides. The inventive isolated protein has the activity of transferring N-acetylgalactosamine to N-acetylglucosamine via betal-4 linkage. The present sequence represents human N-acteylglactosamine transferase, NGalNAc-T1, PCR primer.
                                                 The invention relates to an isolated N-acteylglactosamine transferase
                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               bcl-2 gene; anti-apoptotic gene; prevention; cell death; treatment; neurodegenerative disease; disease; Huntingdon's; Parkinson's; Alzheimer's; retroviral vector; LNXS; LNCX; live packaging cell; blocompatible capsule; release; viral vector; implant; gene therapy; tumour; PCR primer; amplify; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              //note= "Kozak sequence which enhances translation
effeciency of bcl-2"
                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a vector system, for transfection and recombinant polypeptide expression in a mammalian host cell, comprising a first cistron encoding a transactivator protein under control of a first promoter, and a second cistron encoding an apoptosis-protective protein under the control of the first promoter or optionally under the control of a second promoter, where the first and the second cistron are contained in one or more vectors. The vector system is useful for transfecting and expressing recombinant polypeptide in mammalian cells. The present sequence represents a RT-PCR primer for cloning the hamster B
The vectors are used to transfect live packaging cells which form the core of a biocompatible capsule. These packaging cells are able to secrete a viral vector which includes a heterologous gene (in this case bcl-2) encoding a biologically active compound e.g. antisense sequence, blood coagulation factor, or an enzyme. The biocompatible capsules are surrounded by a jacket of permeable material with a porosity that allows calease of the viral vector. The biocompatible capsules are implanted, e.g. into the central nervous system, for use in gene therapy, particularly where the active compound is useful in the treatment of tumours, cancers and other cell proliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein

The invention relates to the use of a polynucleotide comprising a sequence of 3977, 2441 or 3410 base pairs, fully defined in the specification, its fragment or complement, foor diagnosis or treating conizophrenia. The invention also claims a method for screening for a compound regulating the expression of the polynucleotide comprising: (a) bringing a test compound into contact with a cell capable of expressing the polynucleotide, whose expression is desired to be controlled; (b) detecting the expression of the polypeptide in the cell; and (c) detecting the expression of the polypeptide in the cell; and (c) controlled; conpared to a control. The polynucleotides and polypeptides are useful for diagnosing schizophrenia, and for identification of subjects who are predisposed to schizophrenia, and for identification of subjects who are predisposed to schizophrenia, and for evaluating the efficacy of drugs for such disorder, and monitoring the progress of patient symptoms involved in clinical trials for the progress of such disorder. This sequence corresponds to a hybridization

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                      This antisense oligonucleotide is complementary to the translation initiation site of the human bcl-2 mRNA. The Bcl-2 antisense oligonucleotides are phosphorothicate derivatives and can straddle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of a functional bcl-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bcl-2 gene expression, especially lymphomas and some leukaemias. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                            Anti-sense oligo:nucleotide(s) complementary to BCL-2 mRNA - useful for treating cancers, e.g. lymphoma(s) and some leukaemia(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                           Anti-sense oligo:nucleotide(s) complementary to BCL-2 mRNA - useful for
treating cancers, e.g. lymphoma(s) and some leukaemia(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This antisense oligonucleotide is complementary to the translation initiation site of the human bc1-2 mRNA. The Bc1-2 antisense oligonucleotides are phosphorothioate derivatives and can straddle strategic sites such as the translation initiation site, donor and acceptor splicing sites, or sites for transportation or degradation. Blocking translation at such strategic sites prevents the formation of functional bc1-2 gene product. These oligonucleotides may be used for treating cancers associated with high levels of bc1-2 gene expression, especially lymphomas and some leukaemias. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

/note=_Organ: liver; Vector: pumils S-FL3; Site_1: DraIII (CACTGTGTG); ist trand cDNA was primed with an oligo(dr) primer [ATGTGGCCTTTTTTTTTTTTTT]; double-stranded cDNA was ligated to a DraIII adaptor [TGTTGGCCTACTGG] digested and cloned into distinct DraIII sites of the pWHSIS-FL3 vector (5' site CACTGTGTG, 3' site CACTGTGT). XhoI should be used to isolate the CDNA insert. Size selection was
                                                                                                                                                                                                                                                                                                                                                                                                                                         1 (bases 1 to 49)

/note="PCN varies" in the DNA of primary transformants of Orysa sativa plants. The DNA fragment (s) resulting of PCN were directly sequenced from the left border to determine the genomic sequence flanking the insertion.

T-DNA derived sequences were removed Information to order the corresponding mutant line and a link to a database providing a graphical display is available from june 2004 at http://genoplante.info.infobiogen.fr/oryzatagline/.

This sequence has been generated in the framework of the French plant genomics program Genoplante (http://www.genoplante.org and http://genoplante.org and http://genoplante.info.infobiogen.fr)."

(http://www.nbaroures/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114 gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

/note="Vector Sporozoites were obtained from in vitro sporulated
and excysted occysts of E. tenella grown in chickens.
cDMA was synthesized from poly mRNA using an oligo-dT
primer containing a XhoI site. Following second strand
synthesis, EcoR1 adapters were ligated to the cDNA and
products were size-selected on Sephacryl S500. cDNAs were
digested with EcoR1/XhoI and cloned into lambda Zap II
(Stratagene) . Clones were converted to phagemids by mass
excision using ExAssist helper phage and SOLR cells
(Stratagene) . Insert sizes range from 1.2-2.9 kb."

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMAP2 (gill #17321141gbl #AP1290T2.1). a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwn42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

// Abobs="Wector: pT7T3D-pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3

vector. Library is normalized. Library was constructed by Bento Soares and M. Patima Bonaldo. "
polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XI10-Gold (Stratagene) cells and selected for ampicillin resistance."

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gilfal14[gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chamically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

/lab host="E. Coli strain XL10-Gold, T1-resistant, F-"
/clone_lib="Mouse 10kb plasmid UUGCIM library"
/clone_lib="Wouse 10kb plasmid UUGCIM library"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources (documents/dnares). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerses and T4
polymucleotide kinase. Adaptor oligomucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pMD42 (gil 4732114 [gb|AR129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli Xili0-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (15-SEP-2004) Yoshihide Hayashizaki, The Institute of Physical and Chemical Research (RIKEN), Laboratory for Genome Exploration Research Group, RIKEN Genomic Sciences Center (GSC), RIKEN Yokohama Institute; 1-7-22 Suehiro-cho, Tsurumi-ku, Yokohama, Kanagawa, 230-0045, Japan (E-mail:genome-resegsc.riken.jp, URL:http://genome.gsc.riken.jp, Tel:81-45-503-9222,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alternative Splicing Libraries (ASL8) are prepared by: Preparating of single-stranded DNA using a RNA template from full length CDNA libraries, hybridizating of single-stranded DNA, removing of remaining single-stranded DNA, aligneting of regions comprising double-stranded DNA by a set of 4 bp-cutters, capturing of DNA hybrids with loop structures (alternative spliced exon), ligating of r-shaped primers to isolated DNA hybrids with loop structures are isolated DNA hybrids with loop structures. PCR amplification of ligation products and their cloning into PFLCI vector. (Reference).
